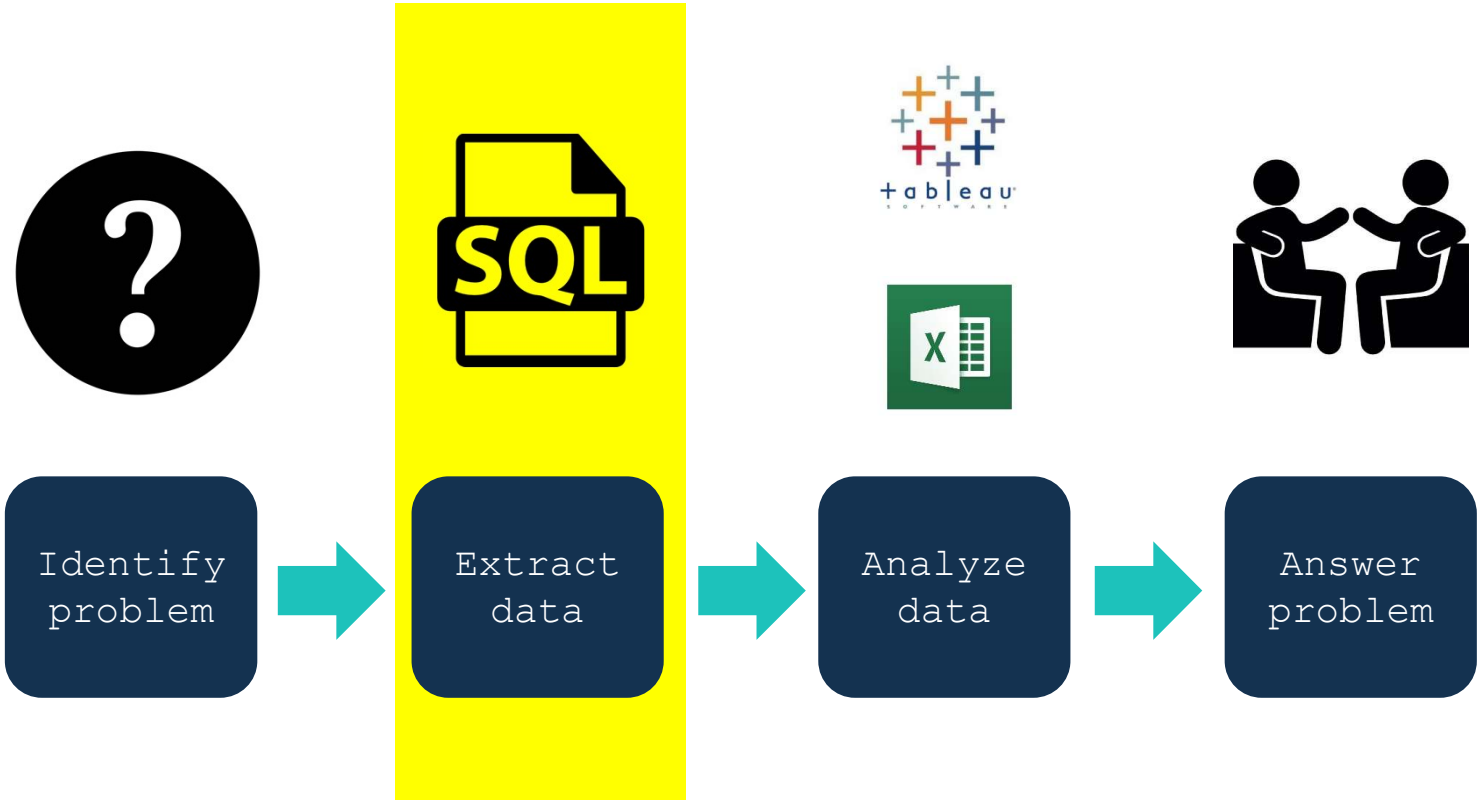
Where does SQL fit in the data flow?



What will I gain from learning SQL?

You are dangerous with SQL

Speak to analysts in their own language

Tell a client you have a great analytics foundation

Eliminate the analytics bottleneck

Today's Agenda

INTRODUCTION (10 min)	**10:00 – 10:10**
Part 1: Database Fundamentals (10 min)	**10:10 – 10:20**
Part 2: Datatype Fundamentals (10 min)	**10:20 – 10:30**
Part 3: Connecting to an RDB (15 min)	**10:30 – 10:45**
Part 4: The Basic Syntax of SQL	**11:00 – 11:30**
Part 5: Filtering with WHERE	**11:30 – 12:00**
Part 6: Aggregations and GROUP BY	**12:00 – 12:30**
LUNCH – (1 HOUR)	**12:30 – 01:30**
Part 7: Fix the SQL CODE	**01:30 – 02:15**
Part 8: Joining Tables	**02:15 – 03:15**
Part 9: Advanced SQL Concepts	**03:15 – 03:30**
Part 10: Conclusion and Next Steps	**03:30 – 03:45**
Q:A	**03:45 – 04:00**

Part 1

DATABASE FUNDEMENTALS

What is a relational database (RDB) and relational database management system (RDBMS)?

Relational Database Management System(s)

Note: Different Dialects of SQL for different Relational Databases

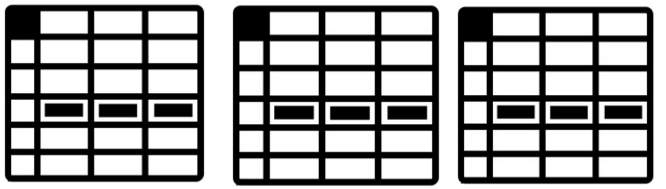
Working with PostGreSQL today

SQL can…

- **SELECT data**
- **INSERT data**
- **CREATE data**
- **UPDATE data**
- **DELETE data**

Relational Database

Related Tables



Sales *Products* *Stores*

How is data organized in an RDB?

Unorganized Data

Schema

ALBUMS SCHEMA		
field/column	**data type**	**sample data**
row	integer	1
artist	text	Red Hot Chili Peppers
album	text	Californication
release_date	date	6/8/1999
genre	text	Rock
plays	integer	120
rating	numeric(10,2)	
org_price	money	
market_value	numeric(10,2)	
burned	boolean	
playable	boolean	

Organized Data in Tables

How is data organized in a table in a RDB?

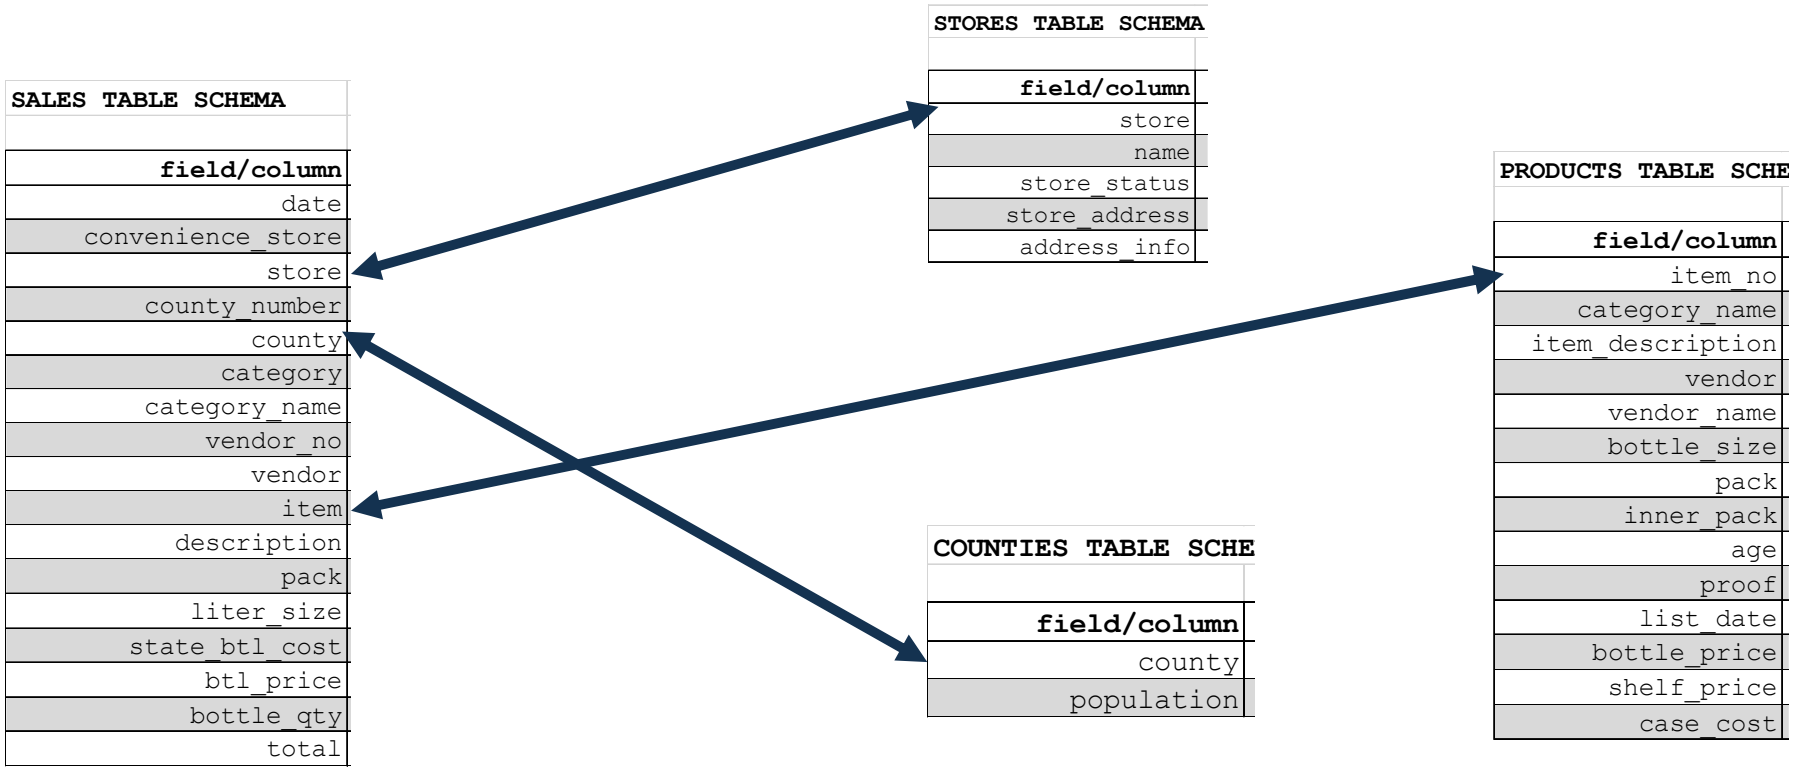
age
proof
list_date
bottle_price
shelf_price
case_cost

Activity 1: Draw an entity relationship diagram between all the tables



Database Fundamentals: Key Takeaways

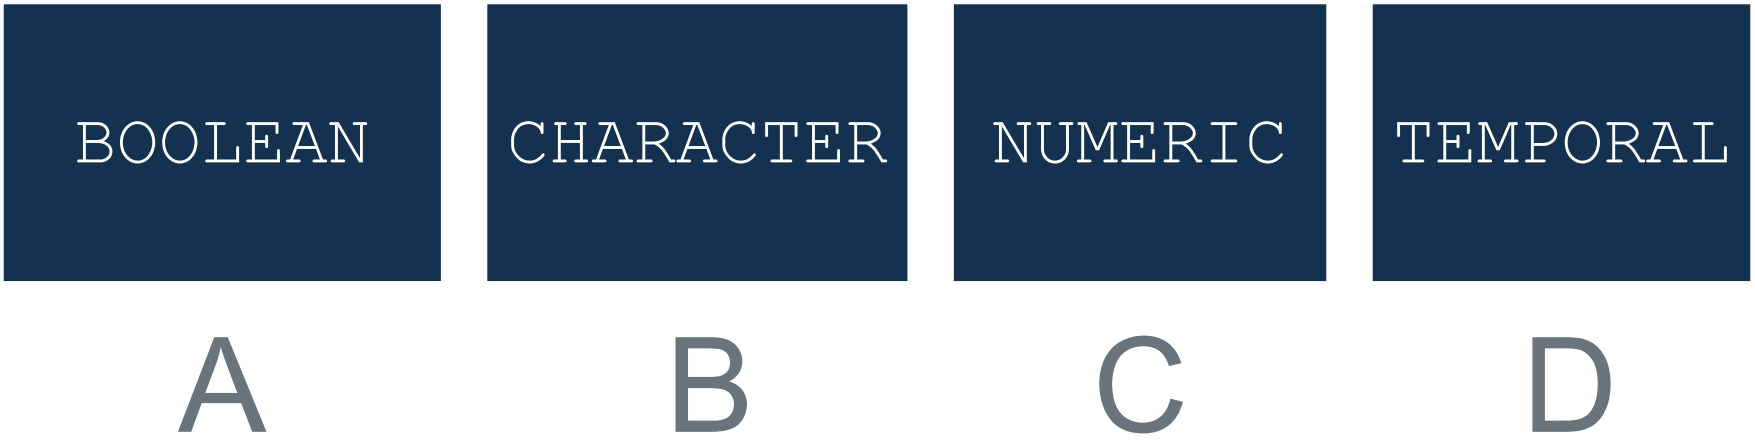
1. Not all tables in a database are related to each other
2. Investigate the column names to see which tables are related to what
3. Not all column/field names are a 1:1 match

Part 2
DATATYPE FUNDEMENTALS

What data types are supported in SQL tables?

DATA TYPE	BOOLEAN	CHARACTER	NUMERIC	TEMPORAL
DATA Example	TRUE / FALSE / (NULL) Or 1 / 0 / (NULL)	ABC / ABC123 / ABC 123 Or (NULL)	4 / 5.1 Or (NULL)	7/4/1776 Or 7/4/1776 23:00:12 Or 23:00:12 OR (NULL)
Field/Column Example	PLAYABLE	ARTIST	RATING	RELEASE DATE

Activity 2: Guess the data type



Activity 2: Guess the data type

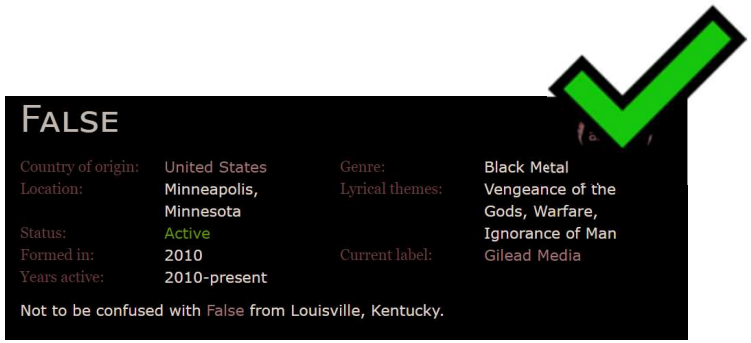
BOOLEAN	CHARACTER	NUMERIC	TEMPORAL
A	B	C	D

FALSE

Activity 2: Guess the data type

BOOLEAN | CHARACTER | NUMERIC | TEMPORAL

A B C D



FALSE

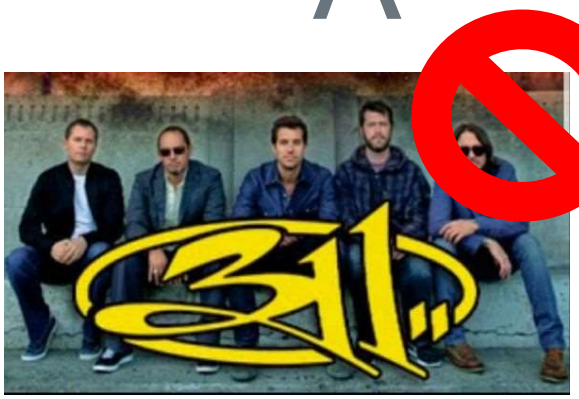
Activity 2: Guess the data type

BOOLEAN	CHARACTER	NUMERIC	TEMPORAL
A	B	C	D

311

Activity 2: Guess the data type

BOOLEAN	CHARACTER	NUMERIC	TEMPORAL
A	B	C	D



Activity 2: Guess the data type

BOOLEAN	CHARACTER	NUMERIC	TEMPORAL
A	B	C	D

4/29/1992

Activity 2: Guess the data type

BOOLEAN	CHARACTER	NUMERIC	TEMPORAL
A	B	C	D

4/29/1992

Datatype Fundamentals: Key Takeaways

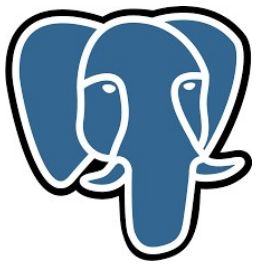
1. Appearances can be deceiving – Find the table schema first, don't guess data types.
2. Data type has influence on how we write and format our SQL code.
3. We can write SQL code to convert datatypes too…

Part 3
CONNECTING TO AN RDB

How do you connect to an RDB?

THIS CLASS

Handout 2: Connecting to 'valerianalytics' database



YOUR ORGANIZATION

Who can help me connect to an RDB at my organization?

YOUR ORGANIZATION

1. Find the Database Administrator (DBA) at your organization. Ask them for credentials

2. If you can't find them, find someone who publishes reports. They will probably know.

3. Remember, you're probably only looking for SELECT privileges in the RDB.

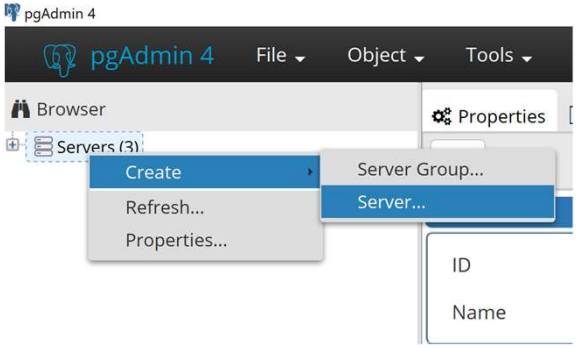
4. Don't GIVE UP, hardest step is just getting access.

How to connect to valerianalytics RDB

1.Download PGAdmin 4 (RDBMS)

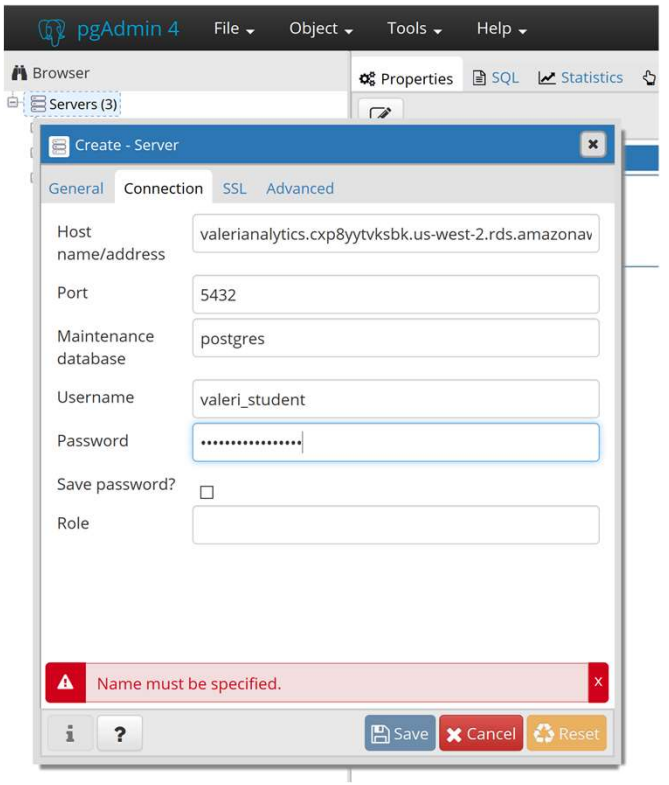
https://www.pgadmin.org/download/

2. Create a server



3. Input credentials details*

(found in Handout 2: Connecting to 'valerianalytics' database)



Part 4
THE BASIC SYNTAX OF SQL

What is the basic syntax of SQL?

- ✔ **SELECT** Fields/columns you'd like to see in result-set
- ✔ **FROM** Table(s) where the fields/columns are located
- **WHERE** Rows/records you'd like to include/exclude in result-set
- **GROUP BY** Fields/columns you want your aggregate dimensions grouped by
- **HAVING** Include/exclude rows/records where aggregate values meet a condition
- **ORDER BY** Sort the rows/records of result-set by ASC/DESC for a column(s)
- **LIMIT** Limit the number of rows/records to include in result-set.

Guided Workshop: Basic SQL Syntax

	row integer	artist text	album text	release_date date	genre text	plays integer	rating numeric (10,2)	org_price money	market_value numeric (10,2)	burned boolean	playable boolean
1	1	Red Hot Chili Peppers	Californication	1999-06-08	Rock	120	4.00	$11.99	3.20	false	true
2	2	Red Hot Chili Peppers	By the Way	2002-07-09	Rock	100	3.50	$11.99	4.00	true	false
3	3	Kanye West	College Dropout	2004-02-10	Rap	200	5.00	$10.99	5.00	false	true
4	4	Kanye West	Late Registration	2005-08-30	Rap	300	4.00	$9.99	7.00	false	true

ASK A QUESTION

GET AN ANSWER

BASIC SQL Syntax: Key Takeaways

1. Any line, any case; SQL can be written on multiple lines or single line in any case for keywords.

2. Comma chameleon; Whatch out for extra or missing commas in SELECT statement. Most common error in SQL

3. If you're having trouble combining multiple/columns fields, you might have to use CAST() to convert data types.

Part 5
FILTERING WITH WHERE

Guided Workshop: Filtering with WHERE

	row integer	artist text	album text	release_date date	genre text	plays integer	rating numeric (10,2)	org_price money	market_value numeric (10,2)	burned boolean	playable boolean
1	1	Red Hot Chili Peppers	Californication	1999-06-08	Rock	120	4.00	$11.99	3.20	false	true
2	2	Red Hot Chili Peppers	By the Way	2002-07-09	Rock	100	3.50	$11.99	4.00	true	false
3	3	Kanye West	College Dropout	2004-02-10	Rap	200	5.00	$10.99	5.00	false	true
4	4	Kanye West	Late Registration	2005-08-30	Rap	300	4.00	$9.99	7.00	false	true
5	5	Kanye West	Graduation	2007-09-11	Rap	250	4.00	$0.00	1.75	true	true
6	6	Papa Roach	Infest	2000-04-25	Rock	75	3.50	$11.99	0.50	false	false
7	7	Kid Cudi	Man on the Moon	2009-09-15	Rap	40	4.00	$10.99	6.00	false	false
8	8	Ratatat	Ratatat	2004-04-20	Electro...	60	5.00	$9.99	6.00	false	[null]
9	9	Ratatat	Classics	2006-08-22	Electro...	400	4.00	$0.00	12.99	[null]	false
10	10	Dragonforce	Sonic Firestorm	2004-05-11	Rock	500	5.00	$2.99	0.01	true	[null]
11	11	[null]	Summer Mix 08	[null]	[null]	1000	5.00	$0.00	0.00	true	true
12	12	[null]	Party Mix 07	[null]	[null]	4000	5.00	$0.00	0.00	true	true
13	13	Common	Be	2005-05-24	Rap	2000	4.50	$0.00	15.00	true	true

15	15	Children of Bodom	Children of Bodom Greate...	[null]	Metal	150	3.00	$0.00	0.00	[null]	false

ASK A QUESTION

GET AN ANSWER

Independent Workshop: Filtering with WHERE

ASK A QUESTION

GET AN ANSWER

Filtering with WHERE: Key Takeaways

1. Many nuances; Syntax for filtering depends on the column data type you are working with.

2. You don't need to SELECT columns you are filtering on in the WHERE clause

3. Use TO_CHAR() function to simplify dates when filtering. Use LIKE with '%' to look for patterns.

Part 6
AGGREGATIONS AND GROUP BY

Guided Workshop: Aggregations and GROUP BY

	row integer	artist text	album text	release_date date	genre text	plays integer	rating numeric (10,2)	org_price money	market_value numeric (10,2)	burned boolean	playable boolean
1	1	Red Hot Chili Peppers	Californication	1999-06-08	Rock	120	4.00	$11.99	3.20	false	true
2	2	Red Hot Chili Peppers	By the Way	2002-07-09	Rock	100	3.50	$11.99	4.00	true	false

ASK A QUESTION

GET AN ANSWER

Aggregations and GROUP BY: Key Takeaways

1. Use GROUP BY when you want to understand aggregates (SUM/ COUNT/ etc.) by specific fields/columns. *I.e. Total sales by Country/Channel.*

2. Aggregate functions and aliases, **DO NOT** go in the GROUP BY.

3. You **CAN NOT** filter on aggregate functions in the WHERE clause, can only filter in HAVING clause.

LUNCH

(1 Hour)

Return at 1:30 PM

Part 7

FIX THE CODE

GROUP Workshop 4: Fix the Code

ASK A QUESTION

GET AN ANSWER

Fix the Code: Key Takeaways

1. **Work backwards;** draw the result-output first

2. **Remove and add back;** Eliminate what doesn't work in the code by commenting out lines with '--' and '/* */'

3. **Ask for help;** collaborate with others

Part 8
JOINING TABLES

What is a JOIN?

Table A - Orders	
OrderID	CustomerID
12345	1
12346	2
12344	8
12355	NULL

Table B - Customers	
CustomerID	CustomerName
1	Chuckie. F
2	Tommy. P
3	Angelica P.
4	Dr. Liptshitz

Why use a JOIN? – We have a question we can't answer from a single table.

What is a JOIN?

Table A - Orders	
OrderID	CustomerID
12345	1
12346	2
12344	8
12355	NULL

LEFT/PRIMARY TABLE

Table B - Customers	
CustomerID	CustomerName
1	Chuckie. F
2	Tommy. P
3	Angelica P.
4	Dr. Liptshitz

RIGHT/SECONDARY TABLE

JOINED TABLE		
OrderID	CustomerID	CustomerName
BLAH	BLAH	BLAH
BLAH	BLAH	BLAH
BLAH	BLAH	BLAH

Same thing as a VLOOKUP in Excel

What is required to join tables in SQL?

Table A - Orders	
OrderID	CustomerID
12345	1
12346	2
12344	8
12355	NULL

Table B - Customers	
CustomerID	CustomerName
1	Chuckie. F
2	Tommy. P
3	Angelica P.
4	Dr. Liptshitz

1. At least 2 tables, with at least 1 column/field in common
2. Column/field(s) tables have in common, **MUST** be same data type
3. The column/field in Table B ***should*** be unique, otherwise duplication will occur *(more on this later)*

What is the JOIN syntax?

```
SELECT
A.ORDERID
,A.CUSTOMERID
,B.CUSTOMERNAME

FROM
ORDERS A

JOIN CUSTOMERS B

ON  B.CUSTOMERID = A.CUSTOMERID

GROUP BY
A.ORDERID
,A.CUSTOMERID
,B.CUSTOMERNAME
```

1. **ASSIGN AN ALIAS** to each table and apply it to each distinct column.

2. **JOIN ON the columns the TWO tables have in common** (make sure same data type)

3. You need indicate what **STYLE of JOIN** *(more than 1 style)*

Table A - Orders

OrderID	CustomerID
12345	1
12346	2
12344	8
12355	NULL

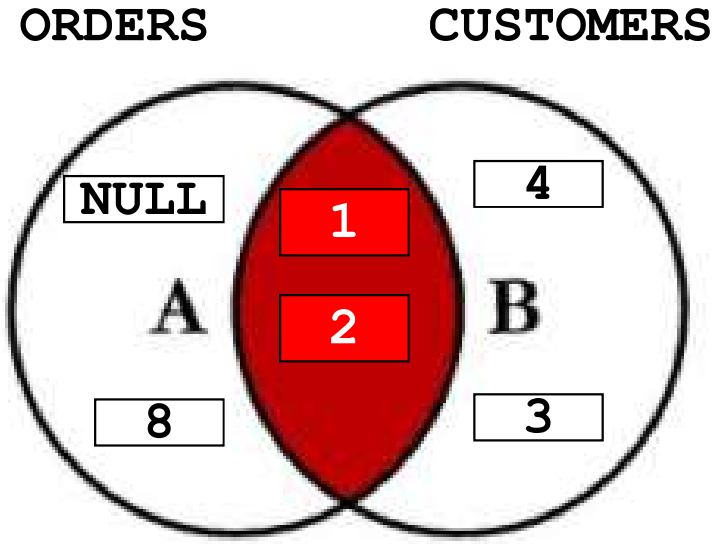
Table B - Customers

CustomerID	CustomerName
1	Chuckie. F
2	Tommy. P
3	Angelica P.
4	Dr. Liptshitz

INNER JOIN RESULT SET (CustomerID)

OrderID	CustomerID	CustomerName
12345	1	Chuckie. F
12346	2	Tommy. P

How do we visualize an INNER JOIN?



```
SELECT <select_list>
FROM TableA A
INNER JOIN TableB B
ON A.Key = B.Key
```

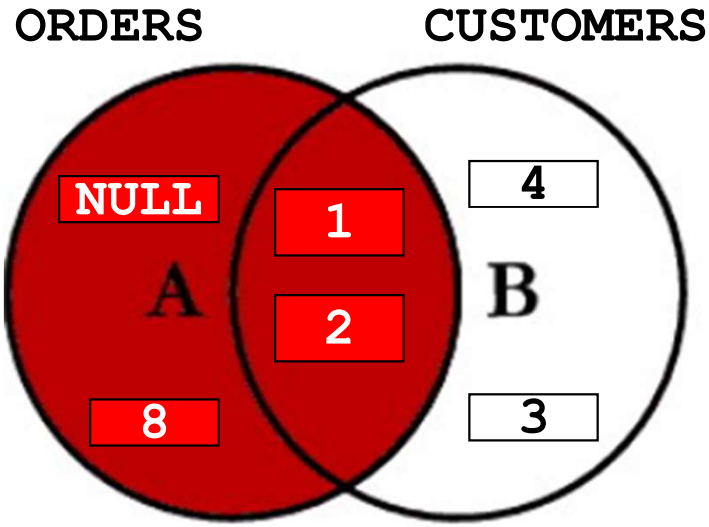
JOIN → EVERYTHING TABLE A and B HAVE IN COMMON

Table A - Orders			Table B - Customers	
OrderID	CustomerID		CustomerID	CustomerName
12345	1		1	Chuckie. F
12346	2		2	Tommy. P
12344	8		3	Angelica P.
12355	NULL		4	Dr. Liptshitz

INNER JOIN RESULT SET (CustomerID)

OrderID	CustomerID	CustomerName
12345	1	Chuckie. F
12346	2	Tommy. P

How do we visualize a LEFT JOIN?



```
SELECT <select_list>
FROM TableA A
LEFT JOIN TableB B
ON A.Key = B.Key
```

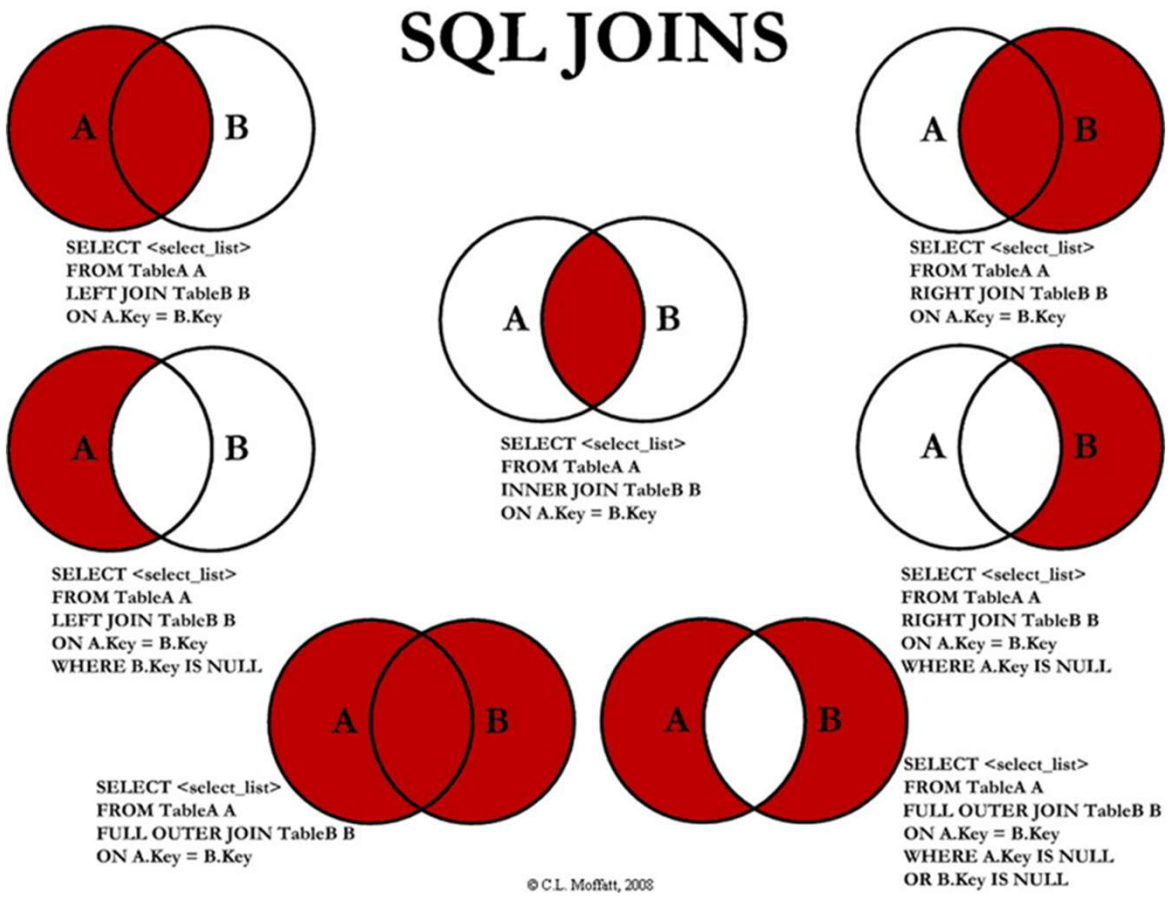
LEFT JOIN → EVERYTHING THAT's in Table A regardless of whether it's in Table B

Table A - Orders			Table B - Customers	
OrderID	CustomerID		CustomerID	CustomerName
12345	1		1	Chuckie. F
12346	2		2	Tommy. P
12344	8		3	Angelica P.
12355	NULL		4	Dr. Liptshitz

LEFT JOIN RESULT SET

OrderID	CustomerID	CustomerName
12345	1	Chuckie. F
12346	2	Tommy. P
12344	8	NULL
12355	NULL	NULL

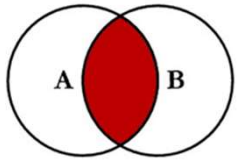
What are the other types of JOINs?



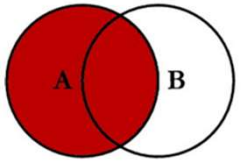
Group Activity: Which JOIN do I use? (20 min)

Table A: ORDERS	
ORDER_ID	**CUST_ID**
12345	567
12346	457
12366	123
14567	(null)
19453	(null)
15678	234

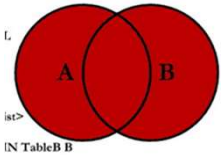
Table B: CUSTOMERS	
CUST_ID	**State**
567	WA
367	SD
678	DE
457	MI
234	(null)



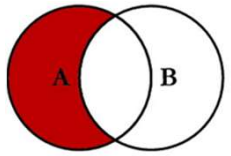
GROUP 1



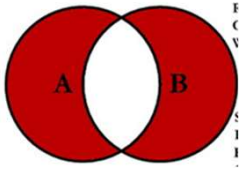
GROUP 2



GROUP 3



GROUP 4



GROUP 5

Question: What is the count of customers and orders by state?

Step 1: Make a joined table of order_id, cust_id, and state. Draw circles to help you.

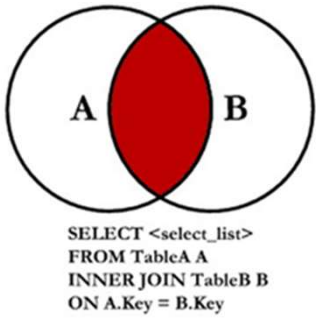
Step 2: Make a table of the count of orders and customers in each state. Remember, don't count NULL customer or order IDS.

Step 3: Tell us the total order and customer count overall.

Which JOIN do I use? (Most Common Use Cases)

"Give me a list of total orders/customers by customer's state."

INNER JOIN

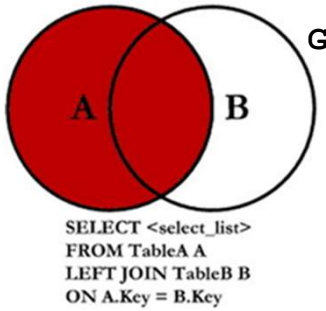


GROUP 1

WILL EXCLUDE ALL ORDERS FOR CUSTOMERS THAT AREN'T IN TABLE B

Consequence: Order count underreported

LEFT JOIN

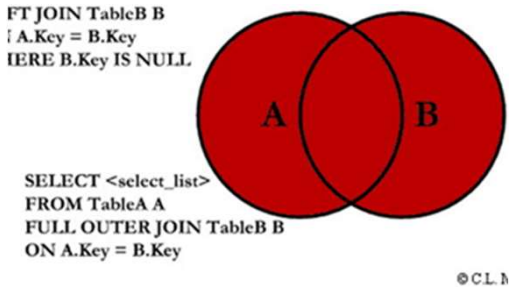


GROUP 2

WILL INCLUDE ORDERS FOR ALL CUSTOMERS, REGARDLESS OF EXISTENCE IN TABLE B.

Consequence: Some orders won't have a state assigned to them (will appear as NULL for State)

FULL OUTER JOIN



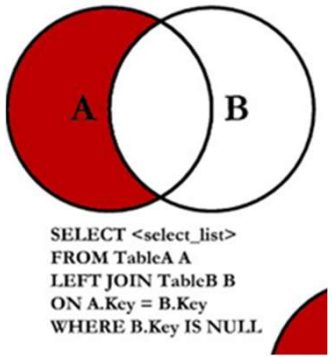
WILL INCLUDE ALL ORDERS AND CUSTOMERS FROM BOTH TABLES

Consequence: Some order's won't have a state assigned to them, and some customer's won't have an order assigned to them.

Which JOIN do I use? (Fringe Use Cases)

"Give me a list of total orders/customers by customer's state."

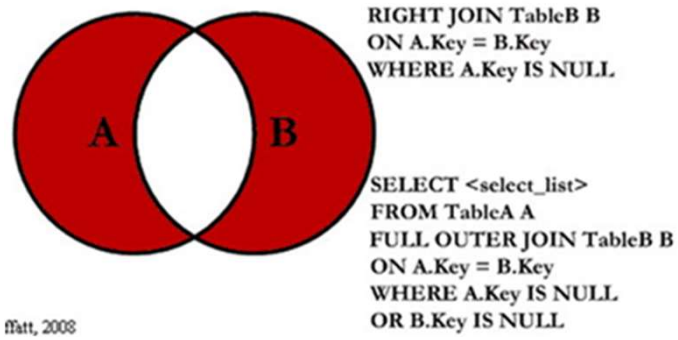
LEFT JOIN, WHERE CUST_ID IS NULL in TABLE B



USE CASE: You only want to see orders for customers that aren't in Table B.

Tell DBA to update Customer Attributes; Table B

FULL OUTER JOIN, WHERE CUST_ID IS NULL in TABLE A and B



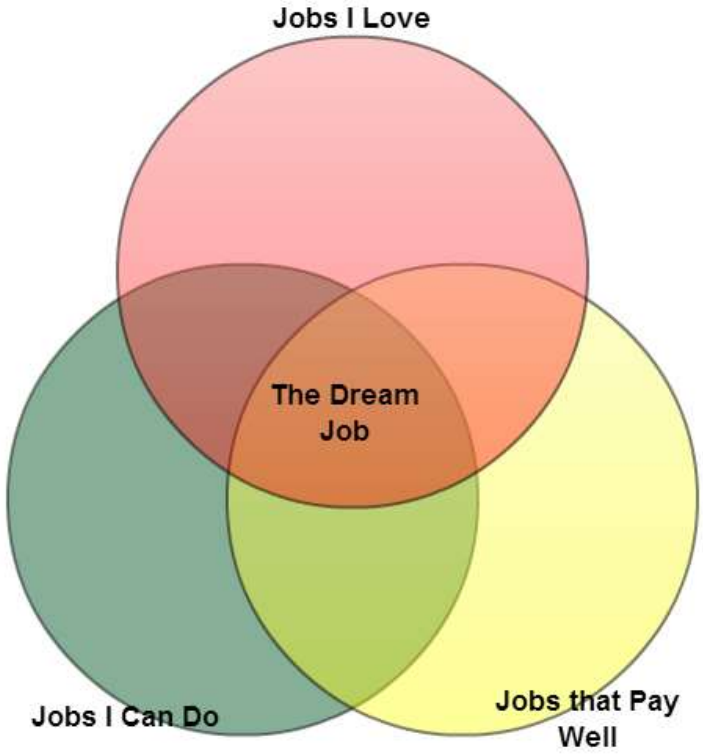
USE CASE: You only want to see orders from customers that don't exist in Table B

AND

You only want to see customers that don't exist in Table A (don't have an order)

Can you join to more than 1 table?

```
SELECT c.field, a.field,
b.field, a.field,c.field
FROM table1 a
JOIN table2 b
ON a.field=b.field
JOIN table3 c
ON a.field=c.field
```



What if you want to join two tables that don't share the same column?

TABLE A: ORDERS

ORDER_ID	CUST_ID
1234	1

TABLE B: ACCOUNT_STATES

ACCOUNT_ID	STATE
ABC	WA

TABLE C: ACCOUNT_MAPPING

CUST_ID	ACCOUNT_ID
1	ABC

```
1   SELECT
2
3    A.ORDER_ID
4   ,A.CUST_ID
5   ,B.STATE
6
7   FROM
8
9   ORDERS A
10
11  LEFT JOIN ACCOUNT_MAPPING C ON A.CUST_ID = C.CUST_ID
12
13  LEFT JOIN ACCOUNT_STATES B ON B.ACCOUNT_ID = C.ACCOUNT_ID
```

SOLUTION: DAISY CHAINING

What if you are getting duplicate records or rows after performing a join?

Table A: ORDERS

ORDER_ID	CUST_ID
12345	567
12346	457
12366	123
14567	(null)
19453	(null)
15678	234

Joining on CUST_ID

Table B: CUSTOMERS

CUST_ID	STATE	UPDATE_DATE
567	WA	1/2/2017
367	SD	1/2/2017
678	DE	1/2/2017
457	MI	1/2/2017
234	(null)	1/2/2017
457	OK	6/7/2018
567	MT	6/9/2018

CUST_ID is not unique in Table B

INNER JOIN

ORDER_ID	CUST_ID	STATE
12345	567	WA
12345	567	MT
12346	457	OK
12346	457	MI

LEFT JOIN

ORDER_ID	CUST_ID	STATE
12345	567	WA
12345	567	MT
12346	457	OK
12346	457	MI
12366	123	(null)
14567	(null)	(null)
19453	(null)	(null)
15678	234	(null)

REQUIREMENTS FOR A JOIN BETWEEN TWO TABLES

1. At least 2 tables, with at least 1 column/field in common
2. Column/field(s) tables have in common, **MUST** be same data type
3. The column/field in Table B ***should*** be unique, otherwise duplication will occur ***(more on this later)***

SOLUTIONS

Dedup TABLE B via Subquery or CTE.

Join on more than column, if possible.

Instructor Led: Write the SQL JOIN as a Class

Hey Analyst, Give me the top 10 stores in terms of sales for 2014. I want them listed by store name.

Framework for approach

1. Draw the result-output first. Determine if you need a join or not.
2. Make sure 3 JOIN requirements are met.
3. Follow 3 rules of the JOIN syntax.
4. Pick appropriate JOIN. Be ready to defend.

JOINING Tables: Key Takeaways

1. If you want to join two tables, they must have 1 column in common, and of the same data type. The rows/records in Table B should be unique, otherwise duplication. Check TABLE B with supplied code.

2. The JOIN style will determine the result-output. Think about what records/rows will be excluded. Left joins are safest.

3. Work backwards, draw result output first, then determine ingredients to writing code.

Part 9
ADVANCED SQL TOPICS

What are some advanced SQL concepts?

Part 10
CONCLUSION

Conclusion: Key Takeaways

1. The more you talk to a database, you more comfortable you'll get.

2. Today's class gave us a framework for not just talking to 'Red', but to any relational database.

3. Don't let anyone stop you from getting to know a database; push hard.

Example Email to Send To Your DBA to Get Access

Hello DBA,

I'd to request SELECT access to our relational database that stores (x) data. Could you supply me the necessary credentials or Wiki for gaining access?

Could you also let me know

1. *Which version of SQL our organization uses? (E.g. Oracle / MySQL / Hive / PostgreSQL / IBM BIG Insights / SQL Server / etc.)*
2. *What RDBMS (or GUI) we use as a query tool?*
3. *Any information regarding the schema structure of the tables in the database for reference.*

Thanks,

Your Name
